FLIP THE TICKET.

Shift the support of enterprise mobile devices and applications from reacting to inbound trouble tickets to proactive monitoring and intelligence.

B2M

DON'T CALL US. WE'LL FIX YOU.

Proactively Find & Fix Enterprise Mobility Issues before your employees ever see there's a problem.

There's a reason companies and the managed service providers who support them are rethinking how they manage enterprise mobility.

Employee use of mobile devices and apps is critical for business success. Any issues or downtime with these mobile assets negatively impact the end-user experience for employees and customers.

Unfortunately, unlike all other critical IT assets, mobile devices and apps are not monitored in real-time today, leaving retailers blind to any issues as they occur and only able to learn of issues if and when employees take time to contact their help desk.

We're fixing the problem by rethinking and redefining enterprise mobility management for Android and Windows devices.

B2M is shifting the way mobility is managed. Instead of depending on inbound help desk calls to identify critical issues, B2M's Elemez software proactively monitors and measures mobility to help find and fix issues as they occur, often before employees notice a problem.

Elemez provides the Mobility Intelligence™ and Intelligent Asset Management needed to proactively find and fix problems related to buggy software updates, battery issues affecting performance, and a myriad of other enterprise mobility issues which have gone unnoticed, under-reported, and sadly unfixed for too long.

Elemez provides intelligence that MDM, EMM, UEM, TEMS, and other mobility management tools can't provide.

This shift is critical to the success of enterprise mobility within your company.

Let's schedule a demo and show how easy it is to get started.
